Office Action Summary

Application No.
08/470,571

Applicant(s)
HARVEY et al

Examiner
William Luther

Group Art Unit
2731

☒ Responsive to communication(s) filed on Mar 4, 1999

☐ This action is **FINAL**.

☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

A shortened statutory period for response to this action is set to expire 3 month(s), or thirty days, whichever is longer, from the mailing date of this communication. Failure to respond within the period for response will cause the application to become abandoned. (35 U.S.C. § 133). Extensions of time may be obtained under the provisions of 37 CFR 1.136(a).

Disposition of Claims

☒ Claim(s) 56-181 is/are pending in the application.

Of the above, claim(s) _____ is/are withdrawn from consideration.

☐ Claim(s) _____ is/are allowed.

☒ Claim(s) 56-181 is/are rejected.

☐ Claim(s) _____ is/are objected to.

☐ Claims _____ are subject to restriction or election requirement.

Application Papers

☐ See the attached Notice of Draftsperson's Patent Drawing Review, PTO-948.

☐ The drawing(s) filed on _____ is/are objected to by the Examiner.

☐ The proposed drawing correction, filed on _____ is ☐ approved ☐ disapproved.

☒ The specification is objected to by the Examiner.

☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. § 119

☐ Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d).

☐ All ☐ Some* ☐ None of the CERTIFIED copies of the priority documents have been
☐ received.

☐ received in Application No. (Series Code/Serial Number) _____.

☐ received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

*Certified copies not received: _____

☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).

Attachment(s)

☒ Notice of References Cited, PTO-892

☐ Information Disclosure Statement(s), PTO-1449, Paper No(s). _____

☐ Interview Summary, PTO-413

☐ Notice of Draftsperson's Patent Drawing Review, PTO-948

☐ Notice of Informal Patent Application, PTO-152

--- SEE OFFICE ACTION ON THE FOLLOWING PAGES ---

Art Unit: 2731

DETAILED ACTION

-Applicant's arguments, of paper no. 22 received 3/15⁴/99, with respect to pending claims 56-181 have been considered but are moot in view of the new ground(s) of rejection.

Overview

-It has come to the Examiner's attention that paper no. 22 cites, as pending claim support, sentences, paragraphs, and passages that do not exist anywhere (**emphasis added**) in the entire instant specification filed Sept. 11, 1987, of pages 1-557.

-The citations have generated the question of whether instant pages 1-557 contain any support, whatsoever, for the instant claims.

-It is because paper no. 22 casts doubt on each of the pending claims that they are herein rejected with his own publications.

-The below rejections under 112 1st paragraph, 2nd paragraph, and under 102 (b) are caused by the choice to cite passages that do not exist in the instant specification of pages 1-557.

Art Unit: 2731

-Applicant must understand that it is necessary for Examiner to find pending claim support in pages 1-557. Thus, the actions of paper no. 22 compel the rejections below.

→ 112 1st paragraph:

-The voluminous support cited per paper no. 22 as written description for pending claims 56-181 has been considered;

-Examiner has reviewed instant pages 1-557 and does not find the cited passages; put in other words, the passages cited as pending claim support were not specifically included in the instant application filed Sept. 11, 1987;

-Moreover, in reviewing pages 1-557, Examiner finds no shorthand inclusion of the cited passages by the vehicle of 'incorporation by reference';

-however, it is trite to say the pages 1-557 must contain written description for pending claims 56-181 to meet 112 1st paragraph;

-Examiner has called, to Mr. Tom Scott's attention, the absence of the cited passages;

Art Unit: 2731

-Mr. Scott and Applicant have acknowledged that they did not include the passages, cited for support, specifically or expressly incorporated by reference in instant pages 1-557;

-Mr Scott has stated that 112 1st paragraph is satisfied 'so long as pending claims are generic to

-the *cited passage embodiment*; and

-the *instant embodiment*' ;

-Examiner finds Mr. Scott's statement to reflect an 'incomplete understanding' ;

-it must first be established that the cited passage embodiments were included in the instant specification pages 1-557 on the date of Sept. 11, 1987, before Mr. Scott's proposed test can be performed;

-thus it should be understood that even if the examiner can conclude that the pending claims are generic to the cited passage embodiment and the instant embodiment', **it is irrelevant unless the cited passage embodiment was included within pages 1-557 on Sept. 11, 1987;**

-Mr. Scott's statement is premised on the requirement that the cited passages were included within pages 1-557; **this however, is not the instant circumstance, the cited passages were**

Art Unit: 2731

not included on in the instant specification of pages 1-557 on Sept. 11, 1987, and therefore are insufficient for satisfying questions of support;

-In conclusion, Examiner finds that Mr. Scott and Applicant did not consider the cited passages as the invention on the date Sept. 11, 1987.

35 U.S.C. 102

-it is not disputed that the cited passages were published more than one year prior to the filing of pending claims 56-181, via U.S. patents 4,694,490 and 4,704,725 respectively. The cited passages were published Sept. 15, 1987, and Nov. 3, 1987; however the pending claims were first filed March ⁴18, 1999. *per Ex. 10/13/99*

-hence, by construction, the cited passages of '490 and '725 are found to clearly anticipate the pending claims;

-Moreover, in a comparison between a) the asserted claim support and b) the universal receiver embodiment published on March 23, 1989, by way of WO 89/02682, ^{Ex.} finds that the differences constitute no more than 'obvious differences'. Hence, W/O 89/02682 is found to suggest the pending claims to the extent that true support exists; *and*

Art Unit: 2731

35 U.S.C. 112 2nd

-as Mr. Scott and Applicant have acknowledged that the cited passages were not specifically or expressly incorporated by reference, pending claims 'fail to claim applicant's invention' . . . 'the invention necessarily must be described by instant pages 1-557'.

'Obvious type' double patenting

-the cited passages correspond to an embodiment which also supports patent claims that have already been granted via '490 and '725;

-the pending claims are obvious variants of the already patented claims and respective patented embodiment of '490 and '725;

-the pending claims being obvious variants, if patented, would thus extend monopolies that are already enjoyed;

-Moreover, 'the Universal Receiver embodiment' of the instant disclosure is also already patented per U.S. patents 4,964,825, 5,109,414, and 5,335,277.

Art Unit: 2731

-pending claims are found to be obvious variants of the '825, '414, and '277 patented Universal

Receiver embodiments;

-pending claims, if patented, would thus extend monopolies already enjoyed on the instant

Universal Receiver embodiment;

Findings of Fact:

-the instant application is:

Application no.	Date	Status
-a continuation of 08/113,329	filed 8/30/93	pending;
-which is a continuation of 08/056,501	filed 5/3/93	now patent 5,335,277;
-which is a continuation of 07/849,226	filed 3/10/92	now patent 5,233,654;
-which is a continuation of 07/588,126	filed 9/25/90	now patent 5,109,414;
-which is a continuation of 07/096,096 (12	filed 9/11/86	now patent 4,965,825;
-which is a continuation-in-part of 06/829,531	filed 2/14/86	now patent 4,704,725;
-which is a continuation of 06/317,510 (filed 11/3/81	now patent 4,694,490.

-none of the pending claims correspond to those existing at the time of filing '87 CIP;

Art Unit: 2731

primarily relevant
 -applicant has identified the '81 Fig 6c Wall Street Week embodiment' as support for pending claims per paper no. 22 pages 51-62 (support is found the corresponding published U.S. patents 4,694,490 and 4,704,725 and spanning respective col 19 line 31 through col 20 line 11);

most
 ④-pending claims ~~may only~~ derive support, from the '87 CIP 07/096,096, if they are to be entitled to an effective priority of Sept. 11, 1987;
pgs 1-557 of
include the c.p.d. of Sept 11, 1987.

what does
 ⑤ - pending claims supported by '81 but not supported by '87 *fail the written description requirement.*
 ⑥ - the entire '81 written description was not specifically included in '87 CIP written description;
as continuity was not maintained

② the '87 CIP did not expressly incorporate by reference the '81 subject matter into the '87 CIP.

it is in
 - findings of facts are *implicitly set forth* in 102 reg. below
 - findings of fact are *relied upon as the basis for* 103 & Obv. type claim *per reg.*

Comments

Conclusions of Law

-applicant is on notice that mixing and matching embodiments from the '81 and '87 CIP will

now and in the future be found to fail the written description requirement of 112 first paragraph;

- it is understood the novelty is a factual inquiry
 - " " " " " " written description is a factual inquiry
 - pending dependent claims *which are* found to contain subject matter from instant pages 1-557 are

considered to 'mix and match' the 'cited support embodiment' and 'the instant ultimate receiver embodiment';

~~dependent claims~~

-when '81 support is alleged.

- unless the scope of claim is coming to not species & does not merely add '87 or does not such claim will be rejected as lacking novelty or is obvious

Art Unit: 2731

Specification

1. The amendment filed 3/4/99 is objected to under 35 U.S.C. 132 because it introduces new matter into the disclosure. 35 U.S.C. 132 states that no amendment shall introduce new matter into the disclosure of the invention. The added material which is not supported by the original disclosure is as follows:

-the amendment to substitute --units-- for "words" page 37 [line 24] and substitution of --words-- for "units" [line 25];

-the amendment received June 6, 1995, paper no. 3, page 2, attempts to 'incorporate by reference' subject matter that was not included in the instant disclosure's pages 1-557 specification on Sept. 11, 1987;

Applicant is required to cancel the new matter in the reply to this Office action.

Claim Rejections - 35 U.S.C. § 112

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to

Art Unit: 2731

make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 56-181 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

Considering claim 56, there is no support for:

- an interactive video apparatus;
- said interactive video apparatus having a video output device for displaying a video presentation;
- originating at said interactive video apparatus at least a first request for content to be displayed in said video presentation;
- communicating one of said at least said first request and a second request to a remote data source;
- receiving from said remote data source said data to serve as a basis for displaying said video presentation;
- processing said data at said interactive video apparatus in order to present at least one of said locally generated image and said image from said remote video source;

Art Unit: 2731

-displaying said locally generated image at said video device in conjunction with said image from said remote video source.

Considering claim 57, there is no support for:

- programming said interactive video apparatus;
- to perform originating;
- to perform communicating;
- to perform receiving;
- to perform processing;
- to perform displaying.

Considering claim 58, there is no support for:

- said interactive video apparatus includes a computer;
- said step of programming comprises storing;
- storing at least one processor instruction in said computer;
- detecting an instruct signal transmitted from one of said remote video source and said remote data source;
- executing said at least one processor instruction in response to said instruct signal.

Art Unit: 2731

Considering claim 59, there is no support for:

- detecting said at least one processor instruction in a signal transmitted from said remote video source;
- detecting said at least one processor instruction in a signal transmitted from said remote data source;
- inputting said at least one processor instruction to said computer.

Considering claim 60, there is no support for:

- said step of originating processing an identifier;
- said step of communicating processing an identifier;
- said step of receiving processing an identifier.

Considering claim 61, there is no support for:

- said identifier identifies mass medium programming;
- said identifier identifies digital programming;
- said identifier identifies both mass medium programming and digital programming.
- said identifier identifies a communications resource;
- said identifier identifies said locally generated image;

Art Unit: 2731

-said identifier identifies all combinations and subcombinations of: mass medium programming digital programming communications resource said locally generated image.

Considering claim 62, there is no support for:

-said identifier is received at said interactive video apparatus from one of said remote video source and said remote data source.

Considering claim 63, there is no support for:

- said interactive video apparatus communicates with said remote data source via a digital information channel;
- said first data received from said remote video source;
- said second data is received from said remote video source;
- said locally generated image by processing said first data;
- said locally generated image by processing said second data.

Considering claim 64, there is no support for:

- said first data received from said remote video source;
- said second data is received from said remote video source;

Art Unit: 2731

- said locally generated image by processing said first data;
- said locally generated image by processing said second data.

Considering claim 65, there is no support for:

- said interactive video apparatus includes a computer;
- said second data received from said remote video source;
- said second data received from said remote video source in a first discrete signal;
- organizing first information contained in said first discrete signal;
- organizing first information contained in said first discrete signal with second information contained in a second discrete signal;
- organizing first information contained in said first discrete signal with second information contained in a second discrete signal in order to enable said interactive video apparatus to process at least one processor instruction comprising said first information and said second information; and
- causing said computer to respond to said at least one processor instruction.

Considering claim 66, there is no support for:

- said step of organizing is performed by an assembler.

Art Unit: 2731

Considering claim 67, there is no support for:

- said step of processing comprises

- storing first programming in order to present a portion of said at least one of said locally generated image and said image received from said remote video source at a particular time or place.

Considering claim 68, there is no support for

- said video output device displays said locally generated image based on said step of storing.

Considering claim 69, there is no support for

- said interactive video apparatus includes a computer which stores said first data.

Considering claim 70, there is no support for:

- wherein said interactive video apparatus includes

Art Unit: 2731

- a computer which generates said locally generated image in response to at least one instruction
- said method further comprising the step of
- outputting said first programming to said computer.

Considering claim 71, there is no support for:

further comprising the step of programming said computer to respond to said at least one instruction.

Considering claim 72, there is no support for

- said step of programming comprises the steps of:
- receiving a programming transmission from said remote programming source; and
- inputting at least a portion of said programming transmission to said computer.

Considering claim 73, there is no support for

- said interactive video apparatus receives
- encrypted video from said remote interactive video source.

Considering claim 74, there is no support for:

Art Unit: 2731

-said interactive video apparatus includes a local device which inputs selected information to said computer, said method further comprising the step of inputting said at least one instruction from said local device to said computer.

Considering claim 75, there is no support for:

- a method of delivering a video presentation at least one receiver station of a plurality of receiver stations each of which includes a receiver, a signal detector, a processor, and an output device, and
- each of which is adapted to detect the presence of at least one control signal and programmed to process downloadable processor instructions,
- said video presentation including (a) a first video image and (b) a second video image,
- said first video image received at said at least one receiver station from a first remote transmitter station,
- said second video image (i) containing at least one datum that
- at least one of completes and supplements said first video image and
- (ii) displayed in conjunction with said first video image, said method comprising the steps of:
 - receiving at one of said first transmitter station and

Art Unit: 2731

- a second_transmitter station said downloadable processor instructions, wherein
- said downloadable processor instructions are capable of causing_said at least one receiver station to generate locally_ and output said second_video image_
- said downloadable processor instructions having at said at least one receiver station
- a target processor to process data;
- receiving said at least one control signal at said transmitter station, wherein said
- at least one control signal is effective at_said at least one receiver station to
- control execution of at least one of said downloadable processor instructions and
- deliver at least said second video image of said video presentation;
- transferring said at least one control signal to said transmitter; and
- transmitting an information transmission comprising said downloadable processor instructions and
- said at least one control signal.

Considering claim 76, there is no support for:

- said method further comprising the steps
- of receiving
- at least a portion of said first video image and said second video image at
- said transmitter station; and

Art Unit: 2731

-transmitting said at least a portion of said first video image and said second video image to said at least one receiver station.

Considering claim 77, there is no support for:

- wherein one of said downloadable code and identification data in respect of said downloadable code is
- embedded in a non-visible portion of a signal containing at least one of said first video image and said second video image.

Considering claim 78, there is no support for:

- said video presentation is displayed at said at least one receiver station and
- downloadable code programs said processor
- (i) to output at least one of video, audio, and text
- one of simultaneously and sequentially with said video presentation
- (ii) to process a viewer reaction to said video presentation and
- (iii) to select information that supplements said video presentation.

Considering claim 79, there is no support for:

Art Unit: 2731

- said target processor generates at least a portion of said second video image by
- processing said data, said method further comprising the step of
- transmitting said data.

Considering claim 80, there is no support for:

- a method of delivering a video presentation at least one receiver station of a plurality of receiver stations each of which includes a receiver,
- a signal detector,
- a processor, and
- an output device, and is adapted to
- detect the presence of at least one signal,
- said method comprising the steps of:
- receiving, at an origination transmitter station, video to be transmitted by a remote intermediate transmitter station;
- delivering a signal containing said video to an origination transmitter, said signal containing said video also containing an instruct signal which is operative at said at least one receiver station to instruct said at least one receiver station to at least one of
- generate and output a local portion of a video presentation and cause said locally generated portion of said video presentation to be displayed in conjunction with said

Art Unit: 2731

video receiving, at said origination transmitter station, at least one control signal that, at the remote intermediate transmitter station, controls the communication of at least one of said video and said instruct signal; and

-transmitting said at least one control signal from said origination transmitter before a specific time.

Considering claim 81, there is no support for:

said at least one control signal comprises at least one of

-a code and a datum which, at

-the remote intermediate transmitter station,

-identifies at least one of (i) said video and

-(ii) data that is at least one of described and promoted in said video, said

method further comprising the step of:

-transmitting from said origination transmitter

-a second control signal

which, at said remote intermediate transmitter station, controls the

communication of said at least one of said video and said instruct signal to a

second transmitter at said specific time.

Art Unit: 2731

Considering claim 82, there is no support for:

- the step of embedding specific one of said at least one control signal in a non-visible portion of a signal containing said video before transmitting said video to said remote intermediate transmitter station.

Considering claim 83, there is no support for

- said specific time is a scheduled time of transmitting said video at said remote intermediate transmitter station.

Considering claim 84, there is no support for:

- A method of delivering a video presentation at least one receiver station of a plurality of receiver stations each of which includes a receiver, a signal detector, a processor, and an output device, and is adapted (how and where?)
 - to detect the presence of at least one signal,
 - wherein at least one processor instruction comprises information content of separate ones of a plurality of discrete signals and
 - said at least one receiver station is capable

Art Unit: 2731

- providing said at least one processor instruction,
- said method comprising the steps of:
 - receiving video at a transmitter station;
 - delivering said video to a transmitter;
 - receiving a first discrete signal of said plurality of discrete signals at said transmitter station, wherein
 - said first discrete signal is operative to provide said at least one processor instruction at said at least one receiver station by enabling said at least one receiver station to
 - organize information contained in said first discrete signal with information contained in a second of said plurality of discrete signals, and said at least one processor instruction instructs said at least one receiver station to deliver a locally generated image for display in conjunction with said video transferring said first discrete signal to said transmitter; and transmitting said video and first discrete signal to said at least one receiver station.

Considering claim 85, there is no support for:

- at least one of identification data and said first discrete signal is embedded in a signal containing said video.

Art Unit: 2731

Considering claim 86, there is no support for:

- said step of transmitting directs said video to said plurality of receiver stations
- at the same time and each of said plurality of receiver stations one of receives and
- processes to said first discrete signal concurrently.

Considering claim 87, there is no support for: wherein said video is encrypted.

Considering claim 88, there is no support for: further comprising the steps of

- receiving said video at a receiver in the transmitter station,
 - communicating said video from said receiver to a memory location, and
 - storing said video at said memory location for a period of time prior to delivering
- said video to said transmitter.

Considering claim 89, there is no support for:

- wherein said video output device includes a viewing screen which
 - displays a first image received from said remote programming source and said step
- of displaying comprises
- replacing less than all of said first image with said locally generated image.

Art Unit: 2731

Considering claim 90, there is no support for:

- said locally generated image is overlaid on said first image.

Considering claim 91, there is no support for:

- wherein said interactive video apparatus includes an audio receiver and ceases
- displaying said locally generated video image, said method further comprising the steps of:
 - receiving, at said audio receiver, audio which describes information displayed in said video presentation; and
 - outputting said audio at said interactive video apparatus before ceasing to display said locally generated video image.

Considering claim 92, there is no support for:

- wherein said at least one control signal is effective at the remote intermediate transmitter station to control at least one of a plurality of selective transfer devices at different times.

Considering claim 93, there is no support for:

Art Unit: 2731

- A method of outputting a video presentation at a receiver station, said video presentation comprising
 - a sequence of outputs and
 - including, as a first of said sequence of **outputs**, a video image, said method comprising the steps of:
 - receiving at least one information transmission at said receiver station,
 - said at least one information transmission containing at least a first discrete signal and at least one control signal;
 - detecting said at least a first discrete signal and said at least one control signal in said at least one information transmission;
 - passing said detected at least a first discrete signal and said detected at least one control signal to at least one processor;
 - organizing information contained in said at least a first discrete signal at said receiver station with information contained in a second discrete signal based on said at least one control signal;
 - passing at least one processor instruction to or within said at least one processor,
 - said at least one processor instruction comprising said organized information from said step of organizing; -

Art Unit: 2731

- responding to said at least one processor instruction at said receiver station based on said step of passing said at least one processor instruction;
- generating an image to replace only a portion of said video image by processing at least one stored subscriber datum based on said step of responding to said at least one processor instruction; and
- outputting said video presentation to a user, said video presentation containing, firstly, said video image and, secondly, said generated image to replace said only said portion of said video image.

Considering claim 94, there is no support for:

- wherein a receiver specific control signal is generated based on at least one of said at least one first discrete signal and said at least one control signal, said method further including the step of:
 - selecting said video image in response to said generated receiver specific control signal.

Considering claim 95, there is no support for:

Art Unit: 2731

-further comprising the step of controlling at least one of a receiver, a switch, a decryptor, an enabling device, a storage device, a computer, and a second output device based on said at least one control signal.

Considering claim 96, there is no support for:

-said generated image to replace at least said portion of said video image contains at least one receiver specific datum, said method further comprising the steps of:

- receiving said video image from a remote station;
- generating said at least one receiver specific datum by processing information stored in a computer; and
- outputting at least one of a simultaneous and a sequential presentation of said received video image and said generated at least one receiver specific datum.

Considering claim 97, there is no support for:

-assembling said at least one processor instruction based on said at least one first discrete signal.

Considering claim 98, there is no support for:

Art Unit: 2731

-said at least one first discrete signal includes only partial information of an identifier
and said at least one processor instruction includes said identifier.

Considering claim 99, there is no support for:

-said at least one first discrete signal designates a specific user input to process, said
method further comprising the step of
-generating output by processing said specific
user input.

Considering claim 100, there is no support for:

further comprising the steps of:

-receiving said at least one subscriber datum; and
-passing said at least one subscriber datum to a storage device.

Considering claim 101, there is no support for:

comprising the step of

-communicating to a remote station data evidencing
-at least one of (1) an availability,
-(2) a use, and

Art Unit: 2731

- (3) usage of at least one of
- (a) said at least one first discrete signal,
- (b) said at least one processor instruction, and
- (c) said video image.

Considering claim 102, there is no support for:

- wherein a user inputs an order, said method further including the step of communicating said order to a remote station.

Considering claim 103, there is no support for:

- wherein a receiver specific control signal is processed based on at least one of said at least one first discrete signal and
- said at least one control signal, said method further including the step of
- outputting said video image in response to said receiver specific control signal.

Considering claim 104, there is no support for:

- wherein a receiver specific control signal is processed based on at least one of
- said at least one first discrete signal and said at least one control signal, said method further including the step of

Art Unit: 2731

-processing user input based on said generated receiver specific control signal.

Considering claim 105, there is no support for:

- wherein a receiver specific control signal is processed based on at least one of
- said at least one first discrete signal and
- said at least one control signal and said image to replace said at least
- said portion of said video and image is generated based on said receiver specific control signal.

Considering claim 106, there is no support for:

- wherein a receiver specific control signal is processed based on at least one of said at least one first discrete signal and said at least one control signal, said
- method further including the step of outputting one of a simultaneous and a
- sequential presentation of
- said video image and
- at least one of a receiver specific video and a receiver specific graphic image based on said receiver specific control signal.

Considering claim 107, there is no support for:

Art Unit: 2731

-wherein said video is received in one of a television and a multichannel information transmission.

Considering claim 108, there is no support for:

- wherein said one of a television and a multichannel information transmission comprises
- an analog television signal.

Considering claim 109, there is no support for:

- wherein said receiver station includes a video monitor which outputs said video presentation,
- wherein said video presentation comprises
- a series of computer generated video display outputs, and
- wherein by processing data said at least one processor
- delivers said generated image to replace at least said portion of said video image at said video monitor
- in one of said series of computer generated display outputs,
- said method further comprising the step of receiving said data from a remote data source.

Art Unit: 2731

Considering claim 110, there is no support for:

- A method of outputting a video presentation at least one of a plurality of receiver stations each of which includes a receiver, a signal detector, a processor, an output device, each of said plurality of receiver stations being adapted to
- detect the presence of at least one control signal and programmed to process at least one processor instruction, said method comprising the steps of:
- receiving at least one transmitter station at least a first discrete signal containing information, wherein
- said at least one processor instruction comprises
- information organized from said information contained in
- said first discrete signal and information contained in a second discrete signal,
- said at least one processor instruction is effective at said at least one of said plurality of receiver stations to
- generate and output only a portion of said video presentation,
- said at least one processor instruction has at said at least one of said plurality of receiver stations a target processor to process data;
- transferring said at least said first discrete signal to at least one transmitter;

Art Unit: 2731

- receiving said at least one control signal at said at least one transmitter station,
- wherein said at least one control signal is operative at said at least one of said plurality of receiver stations to
- organize said information in said first and second discrete signals into said at least one processor instruction; and
- transferring said at least one control signal to said at least one transmitter, and
- transmitting at least one information transmission containing said at least said first discrete signal and said at least one control signal.

Considering claim 111, there is no support for:

- wherein one of a combined and a sequential output of a video image and said only said portion of said video presentation is
- delivered at said output device of said at least one of said plurality of receiver stations, said method further comprising the steps of
- receiving said video image at said at least one transmitter station; and
- transmitting said video image to said at least one of said plurality of receiver stations.

Considering claim 112, there is no support for:

Art Unit: 2731

- wherein at least one
- (i) of said at least said first signal includes identification data pertaining to said video presentation and
- (ii) said at least said first discrete signal is embedded in a nonvisible portion of a signal containing said video image.

Considering claim 113, there is no support for:

- wherein said video image is displayed at said at least one of said plurality of receiver stations and said at least one processor instruction programs said processor at least one of
- (1) to output at least two of video, audio, and text at least one of
- simultaneously and (emphasis)
- sequentially with said video image and
- (2) to process a viewer reaction to said video image and
- (3) to select information that supplements said video image.

Considering claim 114, there is no support for:

- wherein at least one of
- (i) an assembler at said at least one of said plurality of receiver stations

Art Unit: 2731

- organizes said information in said first and second discrete signals into said at least one processor instruction and
- (ii) said at least one control signal contains at least a portion of said at least one processor instruction.

Considering claim 115, there is no support for:

- wherein a television program comprises
- a series of computer generated images, where said at least one of said plurality of receiver stations includes a television monitor which displays said video presentation in said television monitor to
- display said only said portion of said video presentation in one of
- said series of computer generated images, said method further comprising the step of
- transmitting said data.

Considering claim 116, there is no support for:

- method of delivering a video presentation at one receiver station of a plurality of receiver stations each of which includes a receiver, a signal detector, a processor, an output device, and with each of said plurality of receiver stations being adapted to
- detect the presence of at least one signal, wherein said one receiver station

Art Unit: 2731

- displays video received at said one receiver station from a remote transmitter station and is

- adapted to

- display a locally generated image

- in conjunction with said video in response to at least one processor instruction, said method comprising the steps of:

- receiving a first discrete signal at an origination transmitter station and

- delivering said first discrete signal to at least one origination transmitter, wherein

said

at least one processor instruction is comprised of

- information contained in said first discrete signal and information contained in a second discrete signal, and wherein

- one of said one receiver station and a remote intermediate transmitter station is

- adapted to organize said information contained said first discrete signal

- with said information contained in said second discrete signal;

- receiving at least one control signal which at said remote intermediate transmitter station operates to

- control the communication of one of said first discrete signal and said at least one processor instruction;

Art Unit: 2731

- transferring said at least one control signal to said at least one origination transmitter
- before a specific time; and
- transmitting from said at least origination transmitter said first discrete signal and said at least one control signal.

Considering claim 117, there is no support for:

- wherein at least one of
- a combined and
- a sequential output of a video image and said
- only said portion of said video presentation is delivered at said output device of said one receiver station of said plurality of receiver stations,
- said method further comprising the steps of
- receiving said video image at least one transmitter station; and
- transmitting said video image to said one receiver station of said plurality of receiver stations.

Considering claim 118, there is no support for:

- comprising the step of embedding said at least one control signal in an information transmission

Art Unit: 2731

-containing said first discrete signal before transmitting said first discrete signal to said remote intermediate transmitter station.

Considering claim 119, there is no support for:

-wherein said specific time is a scheduled time of transmitting at least one of said first discrete signal and information associated with said first discrete signal from said remote intermediate transmitter station.

Considering claim 120, there is no support for:

-further comprising the step of: transmitting said second discrete signal.

Considering claim 121, there is no support for:

wherein said remote transmitter station transmits
-encrypted video to said one receiver station of
-said plurality of receiver stations.

Considering claim 122, there is no support for:

-wherein a television program comprises

Art Unit: 2731

- a series of computer generated images, where said at least one of
- said plurality of receiver stations includes a television monitor which displays
- said video presentation in said television monitor
- to display said only said portion of said video presentation in one of
- said series of computer generated images,
- said method further comprising the step of transmitting said data.

Considering claim 123, there is no support for:

- A method of delivering a video presentation
- at least one of a plurality of receiver stations
- each of which includes a receiver, a signal detector, a processor, an output device,
- and with each of said plurality of receiver stations
- being adapted
- to detect the presence of at least one signal,
- wherein said video presentation includes
- a first image which is received said at one of said plurality of receiver stations
- from a first remote transmitter station, and
- wherein one of a code and an identifier is operative at a receiver station of
- said plurality of receiver stations to

Art Unit: 2731

- designate one of a second image and a device, said method comprising the steps of:
- receiving at least one of said first remote transmitter station and a second remote transmitter station at least one instruct signal which is
- effective at a particular receiver station of said plurality of receiver stations to
- generate locally and output said second image of said video presentation for
- delivery in conjunction with said first image;
- transferring said at least one instruct signal to at least one transmitter;
- receiving at least one first discrete signal and a control signal at said at least one of said first remote transmitter station and said second remote transmitter station,
- said at least one first discrete signal including
 - only partial information of said one of a code and an identifier and
- said at least one control signal operative to provide said one of a code and an identifier and
- designate at said at least one of said plurality of receiver stations by
- organizing said partial information with information contained in a second discrete signal at said at least one of said plurality of receiver stations, wherein
- said one of a code and an identifier designates said one of said second image and said device at said particular receiver station and is
- operative to cause said instruct signal to be effective at said at least one of said

Art Unit: 2731

plurality of receiver stations; and

-transferring said at least one first discrete signal and said control signal to

said at least one transmitter,

-said at least one transmitter station transmitting at least one information transmission

-containing said instruct signal,

-said at least one first discrete signal, and said control signal to said plurality of

receiver stations.

Considering claim 124, there is no support for:

-wherein at least one of a

-combined and

-a sequential output of a video image and

-said only a portion of said video presentation is

-delivered at said output device of said at least one of said plurality of receiver stations,

-said method further comprising the steps of

-receiving said video image at said at least one transmitter station; and

-transmitting said video image to said at least one of said plurality of receiver

stations.

Art Unit: 2731

Considering claim 125, there is no support for:

- wherein at least one of said at least one instruct signal and said at least one control signal is
- embedded in
- a non-visible portion of at least one of a video signal,
- a multichannel broadcast signal, and a cablecast signal that contains video.

Considering claim 126, there is no support for:

- wherein said at least one origination transmitter transmits said instruct signal, said first discrete signal, and said control signal in a data transmission.

Considering claim 127, there is no support for:

- wherein a switch at said at least one transmitter station
- communicates at least one first signal
- selectively from a receiver and
- one of a memory and a recorder to said at least one transmitter,

Art Unit: 2731

- said method further comprising the step of:
- detecting said at least one first signal which is effective at said transmitter station to instruct communication.

Considering claim 128, there is no support for:

- wherein a controller controls a switch to communicate to said at least one transmitter at least one first signal,
- said method further comprising the step of:
- detecting said at least one first signal which is effective at said transmitter station to instruct transmission.

Considering claim 129, there is no support for:

- further comprising the step of: transmitting to said at least one of said plurality of receiver stations at least one datum that at least one of
- (i) designates one of a time and a channel of transmission of said instruct signal and
- (ii) specifies at least one of a title of and subject matter contained in one of mass medium programming and data associated with said instruct signal.

Considering claim 130, there is no support for:

Art Unit: 2731

- wherein said at least one control signal further
- comprises at least one processor instruction targeted to said processor at
- said at least one of said plurality of receiver stations,
- said at least one processor instruction programming a manner in which
- said processor responds to said instruct signal.

Considering claim 131, there is no support for:

- wherein said at least one of said plurality of receiver stations is
- at least one of
- adapted to detect the presence of said control signal and
- programmed to respond to said instruct signal
- on the basis of the location of one of said control signal and said instruct signal in an
- information transmission,
- said method further comprising the step of
- causing at least a portion of one of said control signal and said instruct signal to
- be transmitted in said location.

Considering claim 132, there is no support for:

- wherein a switch at said at least one transmitter station

Art Unit: 2731

- communicates at least one first signal selectively from said receiver and
- one of a memory and a recorder to said at least one transmitter,
- said method further comprising the step of
- determining a signal source from which to communicate said at least one first signal to said transmitter.

Considering claim 133, there is no support for:

- wherein a switch at said at least one transmitter station
- communicates at least one first signal
- selectively from said receiver and one of a memory and a recorder to said at least one transmitter, said method further comprising the step of
- controlling said switch to communicate at least one second signal to said transmitter in response to said at least one first signal which is effective at said transmitter station to instruct communication.

Considering claim 134, there is no support for:

- wherein a switch at said at least one transmitter station
- communicates at least one first signal selectively from said receiver and one of a

Art Unit: 2731

memory and a recorder to said at least one transmitter, said method further comprising

the step of

-controlling said switch to communicate said at least one first signal from a signal source.

Considering claim 135, there is no support for:

wherein a switch at said at least one transmitter station

-communicates at least one first signal selectively from said receiver and one of a memory and a recorder to said at least one transmitter, said method further

comprising

the step of

-controlling said switch to communicate to said one of a memory and a recorder at least one second signal which is effective at said at least one of said plurality of receiver stations to instruct.

Considering claim 136, there is no support for:

-wherein a controller controls a switch to

-communicate to said at least one transmitter at least one first signal, said method

Art Unit: 2731

further comprising the step of

- inputting to said controller at least one second signal which is effective to
- control said switch.

Considering claim 137, there is no support for:

- wherein a controller controls a switch to communicate to said at least one transmitter at least one first signal, said method further comprising the step of
- controlling said switch to communicate said at least one first signal according to a transmission schedule.

Considering claim 138, there is no support for:

- wherein a controller controls a switch to communicate to said at least one transmitter at least one first signal, said method further comprising the step of
- controlling said switch to communicate from one of a plurality of signal sources.

Considering claim 139, there is no support for:

- wherein a controller controls a switch to communicate to said at least one transmitter at least one first signal, said method further comprising the step of
- controlling said switch to communicate said at least one first signal to at least one

Art Unit: 2731

second transmitter.

Considering claim 140, there is no support for:

- further comprising the step of
- transmitting to said at least one of said plurality of receiver stations said at least one control signal to cause said at least one of said plurality of receiver stations to
- tune to one of a broadcast and a cablecast transmission containing said instruct signal.

Considering claim 141, there is no support for:

- wherein a television program comprises
- a series of computer generated images,
- where said at least one of said plurality of receiver stations includes a television monitor which
- displays said video presentation in said television monitor
- to display said only said portion of said video presentation
- in one of said series of computer generated images, said method further comprising the step of transmitting said data.

Art Unit: 2731

Considering claim 142, there is no support for:

- A method of outputting a video presentation at a receiver station,
- said video presentation including a video image, said method comprising the steps of:
 - receiving an information transmission at said receiver station,
 - said information transmission containing at least a first discrete signal and at least one control signal;
 - detecting said at least a first discrete signal and said at least one control signal in said information transmission;
 - passing said detected at least a first discrete signal and said detected at least one control signal to at least one processor;
 - organizing information contained in said at least a first discrete signal at said receiver station with information contained in a second discrete signal based on said at least one control signal;
 - passing at least one processor instruction to or within said at least one processor,
 - said at least one processor instruction comprising said organized information from said step of organizing;
 - responding to said at least one processor instruction at said receiver station based on said step of passing said at least one processor instruction;

Art Unit: 2731

- generating only a portion of said video image
- based on said step of responding to said at least one processor instruction; and
- outputting said video presentation to a user, said video presentation containing said generated only said portion of said video image.

Considering claim 143, there is no support for:

- A method of outputting a video presentation at a receiver station including:
 - receiving a transmission from a remote station, said transmission containing a video image and one or more first discrete signals;
 - passing said received video image to an output device for delivery to a user;
 - detecting said one or more first discrete signals;
 - passing said information contained in said one or more first discrete signals to a processor in response to said step of detecting;
 - organizing said information contained in said one or more first discrete signals at said receiver station with information contained in one or more second discrete signals;
 - responding, at said processor, to processor instructions comprising said organized information, based on said step of organizing;
 - generating a signal based on said processor instructions; and

Art Unit: 2731

-outputting at least a portion of said video presentation based on said generated signal.

Considering claim 144, there is no support for:

- wherein said generated signal is a generated control signal,
- said method further having one step of the group consisting of:
 - selecting at least one of said transmission and said video image in response to said generated control signal;
 - outputting said video image in response to said generated control signal;
 - processing user input based on said generated control signal;
 - generating at least a portion of said video presentation based on said generated control signal; and
- outputting a simultaneous or
- sequential presentation of said video image and one or more receiver specific video images based on said generated control signal.

Considering claim 145, there is no support for:

- wherein said generated signal is a control signal, said method further comprising the step of

Art Unit: 2731

-controlling one of a receiver, a switch, a decryptor or enabling device, a storage device, a computer, and a second output device based on said control signal.

Considering claim 146, there is no support for:

-wherein said generated signal contains one or more receiver specific data, said method further comprising the step of:

-generating said one or more receiver specific data by processing information stored in a computer.

Considering claim 147, there is no support for:

-further comprising assembling said processor instructions based on said one or more first discrete signals.

Considering claim 148, there is no support for:

-further comprising the step of receiving encrypted video from said remote station.

Considering claim 149, there is no support for:

-wherein said one or more first discrete signals further designate a specific user input to process, said method further comprising the step of

Art Unit: 2731

-generating output by processing said specific user input.

Considering claim 150, there is no support for:

- wherein said receiving station includes a microcomputer, said method further comprising the step of
- controlling said microcomputer in response to said step of detecting.

Considering claim 151, there is no support for:

- further comprising the step of
- communicating to a remote station data evidencing
- the availability,
- use, or
- usage of
- said one or more first discrete signals,
- said processor instructions, or said one or more video images.

Considering claim 152, there is no support for:

- A method of delivering a video presentation at least one receiver station of a plurality

Art Unit: 2731

of receiver stations each of which includes a receiver, a signal detector, a processor, and an output device, and is

- adapted to detect the presence of one or more control signals and programmed

- to process downloadable processor instructions that, at said at least one receiver station, are

- effective to generate and output a local image of said video presentation and have a target processor to process data,

- said video presentation comprised of said local image of said video presentation and a video image which is received at said at least one receiver station from a first remote transmitter station, said method comprising the steps of:

- receiving at one of said first remote transmitter station and a second remote transmitter station said downloadable processor instructions;

- transferring said downloadable processor instructions to a transmitter;

- receiving said one or more control signals at said one of a first remote transmitter station and a second remote transmitter station, wherein said one or more control signals are operative at said at least one receiver station

- to direct said video image to said output device,

- designate a processor to execute said downloadable processor instructions, or

- designate a user input to be processed based on said downloadable processor

Art Unit: 2731

instructions, and wherein said one or more control signals

- enable said at least one receiver station

- to display said local image of said video presentation in

- conjunction with said video image; and

- transferring said one or more control signals to said transmitter; and

- transmitting a transmission comprising said downloadable processor instructions and said one or more control signals.

Considering claim 153, there is no support for:

- wherein a combined or sequential output of said video or graphic image and said specific portion of a video presentation is

- delivered at the output device of said at least one receiver station,

said method further comprising the steps of:

- receiving said video image at said one of said first and second remote transmitter station; and

- transmitting said video image to said at least one receiver station.

Considering claim 154, there is no support for:

- wherein said downloadable processor instructions or

Art Unit: 2731

-a portion of identification data in respect of said downloadable processor instructions are embedded in a non-visible portion of a signal containing said video image.

Considering claim 155, there is no support for:

- wherein said video image is displayed at said at least one receiver station and said downloadable processor instructions program said processor to output video, audio, or text simultaneously or
- sequentially with said video image or
- to process a viewer reaction to said video image or to select information that supplements said video image.

Considering claim 156, there is no support for:

- wherein said one or more control signals incorporate a portion of said downloadable processor instructions.

Considering claim 157, there is no support for:

- A method of delivering a video presentation at least one receiver station of a plurality of receiver stations each of which includes a receiver, a signal detector, a processor,

Art Unit: 2731

and an output device, and is

- adapted to detect the presence of signals, said method comprising the steps of:

- receiving, at an origination transmitter station, a video image to be transmitted by a remote intermediate transmitter station;

- delivering a signal to an origination transmitter,

- wherein said signal contains said video image and includes an instruct signal which

is

- effective at said at least one receiver station

- to generate and output a local image of said video presentation,

- wherein said local image is outputted at said at least one receiver station in

- conjunction with said video image; receiving, at said origination transmitter station, one or more control signals,

- wherein said one or more control signals operate at said remote intermediate transmitter station

- to control the communication of at least one of said video image, and said instruct signal; and

- transmitting said one or more control signals from said origination transmitter before

- a specific time.

Art Unit: 2731

Considering claim 158, there is no support for:

- wherein said one or more control signals comprise a code or datum which
- operates at the remote intermediate transmitter station
- to identify said video image, said method further comprising the step of:
- transmitting from said origination transmitter a second control signal which
- operates at the remote intermediate transmitter station
- to communicate said video image to a second transmitter at said specific time.

Considering claim 159, there is no support for:

- further comprising the step of
- embedding a specific one of said one or more control signals in a non-visible portion
- of said signal containing said video image before transmitting said video image to
- said
- remote intermediate transmitter station.

Considering claim 160, there is no support for:

- wherein said specific time is a scheduled time of transmitting said video image
- at said remote intermediate transmitter station.

Art Unit: 2731

Considering claim 161, there is no support for:

- wherein said one or more control signals are effective at said remote intermediate transmitter station to control one or more of a plurality of selective transfer devices at different times.

Considering claim 162, there is no support for:

- A method of delivering a video presentation at least one receiver station of a plurality of receiver stations each of which includes a receiver, a signal detector, a processor, and an output device,
- wherein said at least one receiver station is
- programmed to process code and adapted
- to detect at least a first of a plurality of discrete signals, said code comprised of information contained in each of said plurality of discrete signals,
- said method comprising the steps of:
- receiving a video image at a transmitter station;
- delivering said video image to a transmitter; receiving said at least said first of said plurality of discrete signals at said transmitter station,
- wherein said at least said first of said plurality of discrete signals
- enables said at least one receiver station to process said code by

Art Unit: 2731

- organizing information contained in said at least said first of said plurality of discrete signals with information contained in a second of said plurality of signals and, thereby,
- to respond to said code, and wherein said code enables said at least one receiver station to generate or
- identify a local image and output said local image in conjunction with said graphic image;
- transferring said at least said first of said plurality of discrete signals to said transmitter; and
- transmitting said video image and said at least said first of said plurality of discrete signals from said transmitter station to said at least one receiver station.

Considering claim 163, there is no support for:

- wherein said at least said first of said plurality of discrete signals comprise
- a portion of identification data and is embedded in a signal containing said video image.

Considering claim 164, there is no support for:

Art Unit: 2731

-wherein said step of transmitting directs said video image to said plurality of receiver

stations at the same time and each of said plurality of receiver stations

-receives or

-responds to said one or more instruct signals

-concurrently.

Considering claim 165, there is no support for:

-wherein said step of transmitting directs at least said video image to said at least one of receiver station of said plurality of receiver stations in a television, radio, or other electronic transmission.

Considering claim 166, there is no support for:

-further comprising the steps of receiving said video image at a receiver in the transmitter station,
-communicating said video image from said receiver to a memory location, and
-storing said video image at said memory location for
-a period of time
-prior to said delivering said video image to said transmitter.

Art Unit: 2731

Considering claim 167, there is no support for:

- A method of outputting a video graphic presentation at a receiver station including:
- receiving, from a remote transmitter station, a transmission that contains at least a first discrete signal of downloadable code and
- a first completed full screen video graphic image,
- said first completed full-screen video graphic image containing
- at least one graphic image;
- passing said received first completed full-screen video graphic image to a video monitor for
- delivery to a user, said video monitor having a viewing screen;
- displaying said first completed full-screen video graphic image at said video

monitor,

- said displayed first completed full-screen video graphic image
- filling the entire surface area of said viewing screen;
- detecting said at least a first discrete signal of said downloadable code;
- passing said at least a first discrete signal of said downloadable code to at least one processor;
- organizing information contained in said at least a first discrete signal at

Art Unit: 2731

said receiver station with information contained in a second discrete signal based on
at least one control signal;
-responding to at least one processor instruction at said receiver station,
-said at least one processor instruction comprising said organized information from
said step of organizing; passing, to said video monitor based on said step of
responding to at least one processor instruction,
-only a portion of a second completed full-screen video graphic image; and displaying,
at said video monitor,
-said second completed full-screen video graphic image,
-said displayed second completed full-screen video graphic image
-filling the entire surface area of said viewing screen and
-containing said passed only a portion of said second completed full-screen video
graphic image and
-only a portion of said first completed full-screen video graphic image,
-wherein said method delivers said video graphic presentation.

Considering claim 168, there is no support for:

- further comprising a step of
- generating said passed only a portion of said second completed full-screen video

Art Unit: 2731

-graphic image in accordance with said at least one processor instruction.

Considering claim 169, there is no support for:

- further comprising the steps of receiving audio from said remote transmitter station,
- and outputting said audio at a speaker during said video graphic presentation.

Considering claim 170, there is no support for:

- wherein said audio describes information displayed in said video graphic presentation.

Considering claim 171, there is no support for:

- A method of delivering a video graphic presentation at least one receiver station
- of a plurality of receiver stations, each of which
- (a) includes a receiver, a signal detector, a processor to execute at least one processor instruction,
- and a video monitor that has a viewing screen,
- (b) is adapted to detect the presence of one or more control signals, and
- (c) is programmed to process said at least one processor instruction,

Art Unit: 2731

- wherein said at least one processor instruction instructs said at least one receiver station

- to pass only a portion of a second completed full-screen video graphic image to said at least one of said video monitor and said television monitor,

- wherein said second completed full-screen video graphic image

- fills the entire surface area of said viewing screen when displayed at said video monitor and

- contains said only a portion of said second completed full-screen video graphic image

- and only a portion of a first completed full-screen video graphic image,

- wherein said first completed full-screen video graphic image fills the entire surface area of said viewing screen when displayed at said video monitor,

- and wherein said second completed full-screen video graphic image contains at least one graphic image,

- said method comprising the steps of: receiving at a transmitter station at least one discrete signal that contains only partial information of said at least one processor instruction and serves as a basis for providing said at least one processor instruction

- at said at least one receiver station;

- transferring said at least one discrete signal to a transmitter;

Art Unit: 2731

- receiving said one or more control signals at said transmitter station,
- wherein said one or more control signals are operative at said at least one receiver station to provide said at least one processor instruction by
- causing said at least one receiver station to
- organize said partial information with information contained in a second discrete signal, said at least one processor instruction
- directing, to said video monitor, said only a portion of said second completed full-screen video graphic image, said viewing screen
- displaying said only a portion of said second completed full-screen video graphic image in conjunction with said one a portion of said first completed full-screen video graphic image;
- transferring said one or more control signals to said transmitter; and
- transmitting a transmission comprising said at least one discrete signal and said one or more control signals,
- wherein said method delivers said video graphic presentation.

Considering claim 172, there is no support for:

- further comprising a step of transmitting at least a portion of said first completed full-screen video graphic image.

Art Unit: 2731

Considering claim 173, there is no support for:

- wherein said first completed full-screen video graphic image also
- contains said at least one graphic image, said method further comprising a step of transmitting said at least one graphic image.

Considering claim 174, there is no support for:

- further comprising a step of transmitting audio that states a significance of information displayed in said video graphic presentation.

Considering claim 175, there is no support for:

- A method of delivering a video graphic presentation at least one receiver station of a plurality of receiver stations,
- each receiver station of said plurality of receiver stations being
- adapted to
- detect the presence of signals and including a receiver, a signal detector, a processor, and a video monitor,
- said video monitor having a viewing screen, said method comprising the steps of:

Art Unit: 2731

- receiving, at an origination transmitter station, a first completed full screen video graphic image that fills the entire surface area of said viewing screen when displayed at said video monitor,
- said first completed full-screen video graphic image to be transmitted by a remote intermediate transmitter station and
- displayed at said video monitor;
- delivering a signal to an origination transmitter,
- said signal containing said first completed full-screen video graphic image and at least one discrete signal that
- contains only a part of at least one processor instruction that
- instructs said at least one receiver station to generate and output only a portion of a second completed full-screen video graphic image,
- said second completed full screen video graphic image
- filling the entire surface area of said viewing screen when
- displayed at said video monitor and
- containing said only a portion of a second completed full-screen video graphic image
- in conjunction with only a portion of said first completed full-screen video graphic image,
- wherein at least one of said first completed full-screen video graphic image and said

Art Unit: 2731

second completed full-screen video graphic image contains at least one graphic image;

-receiving, at said origination transmitter station, one or more control signals, said one or more control signals operate at the remote intermediate transmitter station

-to control the communication of at least one of

-(i) said first completed full-screen video graphic image and said at least one discrete signal,

-(ii) said at least one processor instruction, and

-(iii) said second completed full screen video graphic image; and

-transmitting a transmission that contains said at least one discrete signal,

said first completed full-screen video graphic image and

said one or more control signals from said origination transmitter

before a specific time,

-wherein said method delivers said video graphic presentation.

Considering claim 176, there is no support for:

-further comprising a step of transmitting audio that describes information displayed in said video graphic presentation.

Art Unit: 2731

Considering claim 177, there is no support for:

- A method of delivering a video graphic presentation at least one receiver station of a plurality of receiver stations each of which
- (a) includes a receiver, a signal detector, a processor to execute at least one processor instruction, and a video monitor that has a viewing screen, and
- (b) is adapted to detect the presence of signals, said method comprising the steps of:
 - receiving a first completed full-screen video graphic image at a transmitter station, said first completed full-screen video graphic image
 - filling the entire surface area of said viewing screen when displayed at said video monitor;
 - delivering said received first completed full-screen video graphic image to a transmitter;
 - receiving one or more instruct signals at said transmitter station, said one or more instruct signals at said at least one receiver station
 - designating at least one processor instruction that is operative at said at least one receiver station
 - to generate or
 - identify locally and

Art Unit: 2731

- pass only a portion of a second completed full screen video graphic image to said video monitor,
- said second completed full screen video graphic image
- filling the entire surface area of said viewing screen when displayed at said video monitor and
- containing said only a portion of said second complete full-screen video graphic image and only a portion of said first complete full-screen video graphic image,
- wherein at least one of said first completed full-screen video graphic image and said second completed full screen video graphic image contains at least one graphic image;
- transferring said one or more instruct signals to said transmitter; and
- transmitting said first completed full-screen video graphic image and said one or more instruct signals from said transmitter station to said at least one receiver station, wherein said method
- delivers said video graphic presentation.

Considering claim 178, there is no support for:

- further comprising a step of transmitting audio that describes information displayed in said video graphic presentation.

Art Unit: 2731

Considering claim 179, there is no support for:

- A method of outputting a video graphic presentation at a receiver station including:
 - receiving, from a remote transmitter station, a transmission
 - that contains at least a first discrete signal and
 - a series of video images that each contain at least one graphic image;
 - passing said received series of video images to a video monitor for delivery to a user,
 - said video monitor having a viewing screen;
 - displaying, at said video monitor,
 - a first completed full-screen video graphic image
 - based on said series of video images,
 - said displayed first completed full-screen video, graphic image
 - filling the entire, surface area of said viewing screen;
 - detecting said at least a first discrete signal;
 - passing said at least a first discrete signal to at least one processor;
 - organizing information contained in said at least a first discrete signal
- at said receiver station with information contained in a second discrete signal based
- on
- at least one control signal;
- responding to at least one processor instruction at said receiver station,

Art Unit: 2731

- said at least one processor instruction comprising said organized information from said step of organizing; passing, to said video monitor based on said step of responding to at least one processor instruction,
- only a -portion of a second completed full-screen video graphic image; and displaying said second completed full-screen video graphic image at said video monitor, said -displayed second completed full-screen video graphic image -filling the entire surface area of said viewing screen and -containing said passed only said portion of said second completed full-screen video graphic image and only a portion of said first completed full-screen video graphic image, wherein said method delivers said video graphic presentation.

Considering claim 180, there is no support for:

- further comprising a step of
- generating said passed only a portion of said second completed full-screen video graphic image in accordance with said at least one processor instruction.

Considering claim 181, there is no support for:

Art Unit: 2731

- further comprising the steps of receiving audio from said remote transmitter station,
- and
- outputting said audio at a speaker during said video graphic presentation.

4. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

5. Claims 56-181 are rejected under 35 U.S.C. 112, second paragraph, as failing to set forth the subject matter which applicant(s) regard as their invention. Evidence that claims 56-181 fail(s) to correspond in scope with that which applicant(s) regard as the invention can be found in Paper No. 22 filed 3/15/99. In that paper, applicant has stated that the claims are supported by passages, sentences, and paragraphs that do not exist in the instant disclosure in pages 1-557, and this statement indicates that the invention is different from what is defined in the claim(s) because the claim support ⁴ must be found in instant pages 1-557 (see above).

Double Patenting

6. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a

Art Unit: 2731

patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

7. Claims 56-181 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over: claims 1-13 of U.S. Patent No. 4,694,490; and claims 1-5 of U.S. patent no. 4,704,725.

Considering claims 56-181, applicant's cite passages, sentences, and paragraphs that do not exist in the pending application but correspond to the '81 Fig 6C Wall Street Week embodiment'. Particularly, the so called '81 Wall Street Week embodiment is described in both '490 and '725 spanning from col 19 line 31 through col 20 line 11). Applicant cites this passage via paper no. 22 pages 51-62.

However, it is found that the so called '81 Wall Street Week embodiment directly

Art Unit: 2731

supports already patent claims; more specifically claims 1-13 of '490 and claims 1-5 of '725. Applicant asserts, per paper no. 22 pages 51-62, that '490 and '725 fully support the pending claims. Applicant is taken at his word. Examiner incorporates by reference applicant's paper no. 22 table B1. The patented generic terms such as 'control signals' ('490 col 22 line 35) and 'modification signal' ('490 col 22 line 63), 'modification control signals' ('490 col 22 line 66) as well as the '490 col 24 112 6th paragraph invoked 'means plus function language' requiring that 'all materials and structures specified as necessary for accomplishing the claimed functions' be read into the claim scope (see attached Fed register vol 64 No. 146, published Friday, July 2, 1999), all capture the same support that applicant instantly relies. Hence, further coverage of old patents would have been obvious for the benefit of extending patent monopolies that are found to exist.

8. Claims 56-181 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over: claims 20-25 of U.S. patent no. 4,965,825; 1-71 of U.S. patent no. 5,233,654; 1-56 of U.S. patent no. 5,335,277; and 1-45 of U.S. patent no. 5,887,243.

Considering claims 56-181, the universal receiver embodiments covered via claims 20-25 of U.S. patent no. 4,965,825; 1-71 of U.S. patent no. 5,233,654; 1-56 of U.S. patent no. 5,335,277; and 1-45 of U.S. patent no. 5,887,243 cover such universal

Art Unit: 2731

receiver and corresponding disclosed but more specific SPAM control signals for accomplishing the claimed function. To seek patent coverage accomplishing the pending claim scope but benefiting from the broader '81 disclosure is an obvious manner of broadening claims so as not to have the claim language corresponding to the disclosed SPAM control signals.

Claim Rejections - 35 U.S.C. § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The claims are rejected as best understood given new matter and given indefinite claim scope.

Claims 56-181 are rejected under 35 U.S.C. 102(b and e) as being clearly anticipated by Campbell et al (U.S. patent no. 4,536,791). Campbell et al clearly anticipates the disclosed intermediate station and the receiver station of the '81 support cited per paper no. 22.

Art Unit: 2731

Claim Rejections - 35 U.S.C. § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CAR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).

9. Claims 56-181 are rejected under 35 U.S.C. 103(a) as being unpatentable over WO 89/02682.

Considering claims 56-181, WO 89/02682 suggest a complex universal receiver accomplishing the '81 supported claims (as urged by paper no. 22). The simplification of the system taught in 89/02682 would have been obvious for the benefit of simpler implementation.

Art Unit: 2731

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to *William Luther* whose telephone number is (703) 308-6609. The examiner can normally be reached on Monday through Friday from 9:30 am to 3:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, supervisor Andrew Faile can be reached at (703) 305-4380.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 305-3900.

William Luther
Patent Examiner
October 13, 1999

A handwritten signature in black ink, appearing to read 'W. Luther', with a large, stylized flourish extending from the end of the signature.
